

PROJECT SYNOPSIS

MakeMyTrip Clone

A Frontend Travel Booking Website using HTML, CSS and JavaScript

Student Name	Yash Rajput
Section	NC
University Roll No.	22515000164
Project Title	MakeMyTrip Clone
Project Type	Frontend Web Development
Technologies	HTML, CSS, JavaScript

1. Introduction

The **MakeMyTrip Clone** is a frontend web development project inspired by the MakeMyTrip travel booking website. Its main purpose is to create a simple, attractive and user-friendly travel booking interface where users can search and explore travel services such as flights, hotels and other travel options.

The project is developed using HTML, CSS and JavaScript. HTML creates the structure of the website, CSS handles styling and responsive design, and JavaScript adds interactivity and dynamic functionality.

2. Problem Statement

Online travel platforms have complex interfaces with many interactive components. Beginners often find it difficult to understand how such real-world websites are designed and built. This project addresses that gap by recreating the key interface of a modern travel booking platform using basic web technologies.

3. Objectives

- To understand frontend web development concepts through a real-world project.
- To design a simple, attractive and user-friendly travel booking interface.
- To build a responsive layout that works on desktop, tablet and mobile screens.
- To implement interactive features such as tabs, form validation and carousels using JavaScript.

4. Scope of the Project

The website includes a navigation bar, travel search section, booking options, destination sections, offers and other UI components similar to a modern travel booking platform. The project focuses mainly on **frontend design and user experience** rather than real-time booking or payment processing. Mock data is used in place of live data.

5. Technologies Used

Technology	Purpose
HTML	Website structure and content
CSS	Styling, layout, colours and responsive design
JavaScript	Interactive elements and dynamic functionality

6. Proposed Modules

Module	Description
Navigation Bar	Logo, service links (Flights, Hotels, Holidays etc.) and Login / Sign-up option.
Travel Search Section	Tabbed search forms for flights and hotels with date, city and traveller selection.
Booking Options	Display of available flights/hotels with details and price (mock data).
Offers Section	Promotional offers and deals carousel with coupon codes.
Destinations Section	Popular destination cards with images and starting prices.
Footer	Quick links, support information and social media icons.

7. Methodology

- **Requirement analysis** - study the MakeMyTrip interface and decide the features to include.
- **Design** - plan the page layout, colour scheme and components.
- **Development** - build structure with HTML, style with CSS, add behaviour with JavaScript.
- **Testing** - check functionality, form validation and responsiveness across browsers and devices.
- **Documentation** - prepare SRS, synopsis and final project report.

8. Hardware and Software Requirements

Category	Requirement
Hardware	Computer with minimum 4 GB RAM and a standard processor
Software	Windows / Linux / macOS, modern web browser (Chrome, Firefox, Edge)
Tools	VS Code (or any code editor), Git and GitHub (optional)

9. Expected Outcome

- A fully working, responsive travel booking website interface.
- Practical understanding of HTML, CSS and JavaScript.
- A portfolio-ready project demonstrating frontend design and user experience skills.

10. Limitations

- No real-time booking, payment gateway or back-end database.
- Data shown is static / mock data.

11. Future Scope

- Integrate real flight and hotel APIs for live data.
- Add a back-end (Node.js and database) with user authentication.
- Add online payment (test mode), booking history and price alerts.

12. Conclusion

The MakeMyTrip Clone project helps in understanding frontend web development concepts by building a real-world travel booking interface using basic web technologies. It strengthens skills in layout design, responsive styling and interactive programming, forming a strong foundation for developing full-stack applications in the future.
